

### DESCRIPTION AND RATING

The 6AQ5 is a miniature beam-power pentode designed for use in the audio-frequency power output stage of television and radio receivers. It may also be used as a triode-connected vertical deflection amplifier in television receivers. Within its maximum ratings, the performance of the 6AQ5 is equivalent to that of the 6V6-GT.

Except for heater ratings, the 5AQ5 is identical to the 6AQ5. In addition, the 5AQ5, as a result of its controlled heater warm-up characteristic, is especially suited for use in television receivers which employ series-connected heaters. When the 5AQ5 is used in conjunction with other 600-milliamperere types which exhibit essentially the same heater warm-up characteristic, heater voltage surges across the individual tubes are minimized during the warm-up period.

### GENERAL

#### ELECTRICAL

Cathode—Coated Unipotential

|                          | 5AQ5 | 6AQ5        |
|--------------------------|------|-------------|
| Heater Voltage, AC or DC | 4.7  | 6.3 Volts   |
| Heater Current           | 0.6  | 0.45 Ampere |
| Heater Warm-up Time*     | 11   | ... Seconds |

Direct Interelectrode Capacitances, approximate†

|        | Grid-Number 1 to Plate |    |
|--------|------------------------|----|

| Grid-Number 1 Voltage, approximate<br>$I_b = 0.5$ Milliampere | -37 Volts         |

\* Heater warm-up time is defined as the time required in the circuit shown at the right for the voltage across the heater terminals to increase from zero to the heater test voltage ( $V_1$ ). For this type,  $E = 18.7$  volts (RMS or DC),  $V_1 = 3.73$  volts (RMS or DC), and  $R = 23.5$  ohms.

† Without external shield.

‡ For operation in a 525-line, 30-frame television system as described in "Standards of Good Engineering Practice Concerning Television Broadcast Stations," Federal Communications Commission. The duty cycle of the voltage pulse must not exceed 15 percent of one scanning cycle.

§ With screen tied to plate.

$\pi$  Value given is to be considered as an Absolute Maximum Rating. In this case, the combined effect of supply voltage variation, manufacturing variation including components in the equipment, and adjustment of equipment controls should not cause the rated value to be exceeded.

▲ In stages operating with grid-leak bias, an adequate cathode-bias resistor or other suitable means is required to protect the tube in the absence of excitation.
